CSE 512: Distributed Database Systems

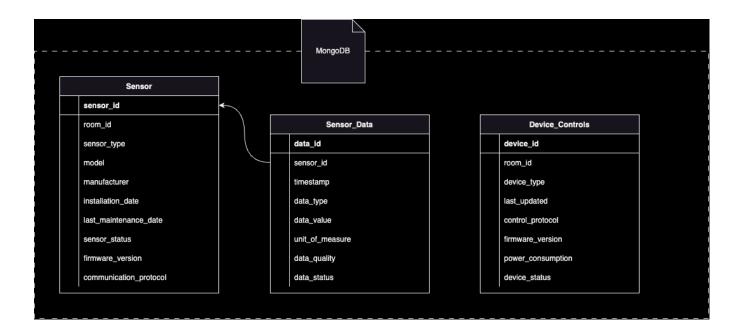

Project: Distributed Database System for a Smart Building

Part - 1

Schema Diagram for Relational Database:

Schema Diagram for NoSQL Database:

Data Distribution Strategy

1. PostgreSQL Database:

Tables:

- Building
- Floor
- Room
- User
- Access Log

Relationships:

- Tables are structured based on the entity types representing physical spaces (**Building**, **Floor**, **Room**) and users (**User**).
- The Access Log table captures logs related to user access.

2. MongoDB Database:

Collections:

- Sensor
- Sensor Data
- Device Control

Document Structure:

• Data related to devices and sensors is stored in MongoDB collections.

- Devices are categorized into different types (Thermostat, Lighting, Air Conditioner, CCTV).
- Sensor data is organized based on different types (temperature, humidity, light, motion).
- Each document within a collection represents a specific device or sensor along with its properties.

Justification

- PostgreSQL is used for relational data, capturing information about physical spaces, users, and access logs.
- MongoDB is chosen for its flexibility in handling unstructured data, making it suitable for storing data related to various types of sensors and devices.
- The distribution aligns with the specific strengths of each database system, optimizing performance and ease of data retrieval for the given use cases.

Advantages:

1. Efficiency:

• Each database system is utilized for its specific strengths, optimizing efficiency in data storage and retrieval.

2. Scalability:

• MongoDB's flexible schema allows easy scalability for adding new types of sensors or devices without significant changes to the data structure.

3. Performance:

• PostgreSQL's relational structure is suitable for efficient querying and retrieval of structured data related to physical spaces and users.

4. Ease of Maintenance:

• Logical separation of data types into different databases simplifies maintenance tasks and enhances system manageability.

5. **Suitability:**

• The chosen strategy is aligned with the specific use cases, providing an optimal balance between relational and non-relational data storage requirements.

Data Retrieval Proof:

Running the following queries to retrieve data from MongoDB:

- 1. Find all sensors with sensor type 'Temperature' and model 'T3000'.
- 2. Count all inactive sensors.
- 3. Find Sensor data with id = 158.
- 4. Count number of poor-quality sensor data.
- 5. Find all device controls with device type 'CCTV' and running Zigbee communication protocol.

```

Running the following queries to retrieve data from PostgreSQL:

- 1. Count all Operational Buildings.
- 2. Get all floors in Building id 1.
- 3. Select users with admin role with name starting with 'A'.
- 4. Count number of denied access logs.
- 5. Select access logs for a specific room.

```
Theory of Operational Buildings: 49
